Why the Report Card Is No Longer Enough

In this **April edition**, we explore how **portfolios, performance tasks, and skills-based assessment** can make learning more visible than grades alone. We look at what strong evidence includes, how growth can be shown over time, and why this shift is gaining ground in India and globally.

What a Strong Portfolio Really Includes

In **India's assessment direction**, a strong record is broader than a mark sheet. **The Ministry of Education** describes a 360-degree progress card that can include self- and peer assessment, project- and inquiry-based learning, group work, role plays, quizzes, and portfolios, while **NCERT's** new Grade 9 syllabus says Holistic Progress Cards should be integrated into formative assessment.

Performance Tasks Make Skills Easier to See

CBSE's new **CT & AI curriculum** for Classes III-VIII aims to build AI-ready learners through logical reasoning, problem-solving, creativity, critical thinking, ethical technology use, and project-based learning. **UNESCO has made the wider case too:** in the AI age, assessment has to move beyond recall and toward higher-order thinking, creativity, and ethical reasoning.

FROM SCORES TO SHARED UNDERSTANDING

Competency Language Parents Can Actually Use

This shift only works when schools explain learning in plain language. **CBSE** now explicitly asks schools to brief parents on curriculum changes, and **India's progress-card model** is designed to show what a learner can do across cognitive, affective, and psychomotor domains, not just the final score.

Showcasing Growth Over Time

Growth becomes more credible when schools show the starting point, the feedback, and the stronger revision. And it is already visible globally: more than **103,000 IB Middle Years Programme** students received eAssessment and personal project results in 2025, with ePortfolios moderated to international standards.

Regional Momentum Around Skills

Across the region, the signal is similar: readiness is being defined through applied skills. **Dubai's strong PISA** results in creative thinking and financial literacy, **Qatar's** move into **WorldSkills Asia**, and the **UAE's rollout of AI** as an official school subject all point toward learning that students can demonstrate, not just describe.

THE WORLD IS RETHINKING ASSESSMENT

Spotlight: Broader Evidence Is Moving Mainstream

The OECD's January 2026 review of upper-secondary certification shows that many systems already use a broader mix of assessment tasks, including practical activities, performances, projects, portfolios, naturally occurring evidence, and teacher-developed tasks. The question is no longer whether alternatives to exams exist, but **how well schools combine them**.

In the News: Portfolio Routes Are Already Live

This is not just theory. Cambridge's June 2026 portfolio-of-evidence route opened for submission on April 1, 2026, and its guidance says portfolios can include coursework, mock exams, extended projects, essays, assignments, problems, and practical tasks, **all marked by Cambridge examiners to Cambridge standards**.

Closing Note

Taken together, the **strongest direction this year** is not anti-standards; **it is pro-better evidence**. India's curriculum updates, global portfolio models, and current assessment thinking all point the same way: families need clearer proof of what students can do, how they improved, and whether they are ready for what comes next.
